Drilling commences on Jimblebar Range

Diversified Pilbara explorer Warwick Resources has commenced drilling at its Jimblebar Range iron ore project near Newman in the Pilbara region of Western Australia.

Jimblebar Range is located 8km from BHP Billiton's world class Jimblebar iron ore mine and railway, and 1km from the Warwick's Jimblebar Channel Iron Deposit (CID).

Geological mapping of Jimblebar Range has outlined an area of iron enrichment in excess of 250,000 square metres, developed over a steeply dipping sequence of Banded Iron Formation.

Warwick Resources operations

According to Warwick, the high-grade of the iron enrichment has been demonstrated by the results of 19 rock chip sample traverses, with 10 samples assaying greater than 60% Fe, including a maximum value of 64% Fe. Levels of contaminants are low to moderate, indicating potential for direct shipping ore.

Warwick said results from the program are expected in mid-April and, subject to exploration success, the company will quickly move into resource drilling.

Jimblebar Range is one of three substantial iron ore targets that Warwick Resources has identified since listing.

The company announced significant first pass drilling results from its Caramulla South Marra Mamba iron ore and Jimblebar CID projects in November last year, including 21m @ 56.3% Fe and 11m @ 59.2% Fe (Caramulla South), and 7m @ 55.5% Fe (CID).
