

Warwick targets high-grade extensions

Diversified Pilbara explorer, Warwick Resources has commenced drilling at its Jimblebar and Copper Range projects near Newman in Western Australia.

Following the recent completion of Aboriginal heritage clearances, Warwick Resources said it was planning an aggressive campaign of drilling on its gold, copper and other projects in the remaining half of 2007.

The company's current drilling program is designed to follow up the success of the last program, targeting extensions to high-grade gold and copper mineralisation.

The program will include seven holes at Jimblebar, testing down-dip and strike extensions to high-grade gold shoots identified at the Sunny South prospect in the company's last drilling program; seven holes over a 5km strike length of the Copper Range project, testing EM targets and outcropping copper mineralisation; and four holes at Copper Knob prospect, to increase the strike length of copper mineralisation drilled by Warwick to 500m (currently 250m).

Warwick said it expects to receive results from drilling at Jimblebar near the end of September, with results from the Copper Range drilling due in early October.

Warwick Resources Technical Director, Bruce McQuitty said well funded exploration was the key to drive shareholder value.

"Warwick's focus is on exploration excellence and we are in a fortunate position of advancing a number of highly prospective targets following Aboriginal heritage clearances," Mr McQuitty said.
