High-grade gold results from Jimblebar

Pilbara explorer Warwick Resources has received further high-grade gold intersections from its Jimblebar project, located near Newman in Western Australia.

The best intersections came from the Sunny South prospect and included 1m @ 17.1 g/t Au from 26m depth in drill hole WRKRC51, and 1m @ 11.8 g/t Au and 10m @ 4.0 g/t Au from 18m and 22m depth respectively, in drill hole WRKRC52.

Warwick is targeting predominantly open pit gold resources at the historic Jimblebar goldfield, which has a 2km strike length and potential extensions up to 8km. Exploration to date has focused on Sunny South where high-grade gold mineralisation has been identified at shallow depths.

Warwick Resources Managing Director, Bruce McQuitty said results from the drilling program were highly encouraging, and provided an improved understanding of the local controls to gold mineralisation.

"The results confirm the presence of high-grade gold mineralisation associated with a felsic intrusive unit at Sunny South," Mr McQuitty said.

"Our modelling shows that nuggety high-grade gold is contained within a series of moderately-dipping stacked lodes. The lodes display good continuity and remain untested below 50m depth and sparsely tested along strike.

"Drilling results have also outlined a substantial molybdenum anomaly at Shearers, which will be the subject of further investigation," he said.
